

Objective:

- Students will know how to use and be able to prove the vertical angle theorem.

Naming an Angle:

How many different ways can you name this angle?

- $\angle ABC$
- $\angle CBA$
- $\angle B$
- $\angle 1$

Different Kinds of Angles:

next to

Adjacent Angles: 2 angles that share a common side and a common vertex
 Examples: $\angle 1$ & $\angle 2$ $\angle 3$ & $\angle 4$ $\angle 9$ & $\angle 8$ $\angle 4$ & $\angle 1$

Linear Pairs: 2 angles that are adjacent and supplementary
 Examples: $\angle 1$ and $\angle 2$ $\angle 4$ & $\angle 3$ $\angle 5$ & $\angle 6$ $\angle 9$ and $\angle 5$

Vertical Angles: 2 nonadjacent angles formed by 2 intersecting lines
 Examples: $\angle 1$ and $\angle 3$ $\angle 9$ & $\angle 6$ $\angle 4$ & $\angle 2$

Supplementary Angles: 2 angles whose sum is 180° .
 Examples: $\angle 1$ & $\angle 2$ $\angle 5$ & $\angle 6$ $\angle 4$ & $\angle 3$ $\angle 2$ & $\angle 3$

Complementary Angles: 2 angles whose sum is 90° .
 Examples: $\angle 9$ & $\angle 8$

2 angles in a line across always same size

Right Angles: angles equal to 90° .
 Examples: $\angle 7$

Practice Set:

<p>1) What are the measures of $\angle 1$, $\angle 2$, $\angle 3$?</p> <p>$\angle 1 = 90^\circ$ $\angle 2 = 50^\circ$ $\angle 3 = 40^\circ$</p>	<p>2) If $m\angle B = 37^\circ$, find the measure of its complement.</p> <p>$90 - 37 = \boxed{53^\circ}$</p>	<p>3) If $m\angle B = 87^\circ$, find the measure of its supplement.</p> <p>$180^\circ - 87^\circ = \boxed{93^\circ}$</p>
---	--	---

4)

- a) Name an angle adjacent to $\angle KQP$
 $\angle KQL$ OR $\angle PQM$
- b) Name an angle supplementary to $\angle PQJ$
 $\angle KQP$ OR $\angle JQN$
- c) Name an angle complementary to $\angle LQN$
 $\angle NQJ$
- d) List a pair of vertical angles.
 $\angle NQJ$ and $\angle KQP$ OR $\angle KQL$ and $\angle JQM$
- e) Name two angles that form a linear pair.
 $\angle KQL$ and $\angle LQJ$

5) $\angle A$ and $\angle B$ are complementary. Find $m\angle A$ and $m\angle B$ if $m\angle A = 3x - 5$ and $m\angle B = x + 15$.

$$\angle A + \angle B = 90^\circ$$

$$3x - 5 + x + 15 = 90^\circ$$

$$4x + 10 = 90^\circ$$

$$\begin{array}{r} 4x + 10 = 90^\circ \\ -10 \quad -10 \\ \hline 4x = 80 \\ \frac{4x}{4} = \frac{80}{4} \\ x = 20^\circ \end{array}$$

$$m\angle A = 3(20) - 5$$

$$m\angle A = 55^\circ$$

$$m\angle B = 20 + 15$$

$$m\angle B = 35^\circ$$

6) $\angle A$ and $\angle B$ are supplementary. Find $m\angle A$ and $m\angle B$ if $m\angle A = 2x + 5$ and $m\angle B = 3x - 10$.

$$\angle A + \angle B = 180^\circ$$

$$2x + 5 + 3x - 10 = 180$$

$$5x - 5 = 180$$

$$\begin{array}{r} 5x - 5 = 180 \\ +5 \quad +5 \\ \hline 5x = 185 \\ \frac{5x}{5} = \frac{185}{5} \\ x = 37 \end{array}$$

$$m\angle A = 2(37) + 5$$

$$m\angle A = 79^\circ$$

$$m\angle B = 3(37) - 10$$

$$m\angle B = 101^\circ$$

7) Write an equation and solve for x.

$$(2x + 21)^\circ$$

$$4x^\circ$$

$$2x + 21 = 4x$$

$$\begin{array}{r} 2x + 21 = 4x \\ -2x \quad -2x \\ \hline 21 = 2x \\ \frac{21}{2} = \frac{2x}{2} \\ x = \frac{21}{2} \end{array}$$

8) Solve for x and y.

$$x^\circ$$

$$(3y - 36)^\circ$$

$$54^\circ$$

$$(4y + 6)^\circ$$

$$54 = 3y - 36$$

$$\begin{array}{r} 54 = 3y - 36 \\ +36 \quad +36 \\ \hline 90 = 3y \\ \frac{90}{3} = \frac{3y}{3} \\ y = 30 \end{array}$$

$$x = 4y + 6$$

$$x = 4(30) + 6$$

$$x = 126$$

9) Given: Lines l and m intersect to form vertical angles $\angle 1$ and $\angle 3$.
Prove: Vertical Angles Theorem: $m\angle 1 \cong m\angle 3$

Statement	Reason
1) Lines l and m intersect to form vertical angles $\angle 1$ and $\angle 3$	1) Given
2) $\angle 1$ and $\angle 2$ are supplementary $\angle 3$ and $\angle 2$ are supplementary	2) Linear pairs
3) $m\angle 1 + m\angle 2 = 180^\circ$ $m\angle 3 + m\angle 2 = 180^\circ$	3) supplementary angles
4) $m\angle 1 + m\angle 2 = m\angle 3 + m\angle 2$	4) substitution prop.
5) $m\angle 1 \cong m\angle 3$	5) subtraction prop.
